Message from the Guest Editors

Dear Colleagues,

The prevalence of patients with end-stage renal disease (ESRD) has been increasing globally and today, 90% of countries use hemodialysis (HD) as a treatment for end-stage renal disease. Hemodialysis patients experience the high risk of weight loss, muscle wasting, anemia, cardiovascular events, infection, and mental health problems, which causes higher rates of morbidity and mortality. Nutritional management and life care are important approaches to improve the quality of care and patients' outcomes.

In this Special Issue, we aim to collect evidence of the most recent advances in research, practice, and policy within this field of study. Scientific articles related to empirical works (original articles), systematic reviews and meta-analyses are encouraged for submission to this Special Issue.
