Message from the Guest Editors

Chronic kidney disease (CKD) constitutes a major health problem worldwide. Patients with severe CKD and dialysis patients exhibit an incredibly high risk of death, mainly due to cardiovascular disease, which is not sufficiently explained by traditional nor by non-traditional, uremia-related risk factors. With more frequent undernutrition, nutritional disorders have been associated with poor quality of life and reduced patient survival. Optimal nutritional status remains a poorly established issue, while the nutritional management of non-dialysis, dialysis, and transplanted patients is a tremendously challenging area of everyday clinical practice.

This Special Issue is an attempt to present a holistic approach to the nutritional management of CKD along the different stages, from non-dialysis CKD 1–5 patients to various dialysis modalities and renal transplant recipients. Therefore, we invite researchers to contribute original research or review articles and we hope that this research topic will offer insight into the nutritional management of CKD.
