Extension of Healthy Life Span of Dialysis Patients in the Era of a 100-Year Life

Guest Editors:

Dr. Masaaki Inaba

Kidney Center, Ohno Memorial Hospital, 1-26-10, Minami-Horie, Nishi-ku, Osaka 550-0015, Japan

Prof. Dr. Katsuhiko Mori

Department of Nephrology, Osaka City University Graduate School of Medicine, 1-4-3 Asahimachi, Abeno-ku, Osaka 545-8585, Japan

Deadline for manuscript submissions:
closed (28 February 2021)

Message from the Guest Editors

Dear Colleagues,

Malnutrition becomes a greater health problem with an increasing number of elderly CKD patients on dialysis. In addition, the presence of diabetes, inflammation, sarcopenia/frailty, and CVD is a definite and independent risk factor associated with higher mortality in this population. Although restriction of protein intake has been recommended to protect eGFR decline and hyperphosphatemia in CKD patients, it might accelerate the loss of skeletal muscle and adipose mass leading to poor prognosis. Therefore, increased protein and calorie intake might be preferred on the basis of survival rate.

This Special Issue aims to update the information about malnutrition to improve QOL and extend healthy life expectancy in advanced CKD patients. We will comprise manuscripts of papers presented in Symposium sessions related to 'Nutrition' at the 2020 65th Annual Meeting of the Japanese Society for Dialysis Therapy: Extension of Healthy Life Span of Dialysis Patients in the Era of 100-Year Life.
