

Fabrication of Optical Fiber and Fiber Amplifiers: From Design to Applications

Guest Editors:

Dr. Shiyong Xiao

School of Electronic and Information Engineering, Beijing Jiaotong University, Beijing, China

Dr. Beilei Wu

School of Electronic and Information Engineering, Beijing Jiaotong University, Beijing, China

Dr. Yudong Lian

Hebei Key Laboratory of Advanced Laser Technology and Equipment, Tianjin, China

Deadline for manuscript submissions:

15 October 2024

Message from the Guest Editors

The earliest development stage of optical fibers benefited from peoples' pursuit of high-capacity communication. Apart from light transmission, optical fibers can also be utilized in sensing, filtering, amplification, and lasering.

Fiber amplifiers comprise an important branch of fiber optic devices. There are two main categories of fiber amplifiers: rare-earth-doped fiber amplifiers and nonlinear fiber amplifiers.

This Special Issue on “Fabrication of Optical Fiber and Fiber Amplifier: From Design to Applications” will welcome basic, methodological, and cutting-edge research contributions, as regular and review papers that focus on:

- The development and improvement of materials, and design and fabrication methods for optical fibers;
- Specialty optical fibers, such as micro-structured optical fibers and polymer fibers;
- Special erbium-doped fiber amplifiers, such as few-mode EDFAs and multicore EDFAs;
- Other rare-earth-doped fiber amplifiers;
- Nonlinear fiber amplifiers, including fiber Raman amplifiers and fiber Brillouin amplifiers;
- Applications based on optical fibers and fiber amplifiers, such as optical fiber sensors and optical fiber lasers.
