Message from the Guest Editors

The use of thermal enhanced oil recovery methods are attracting wide interest in exploiting heavy oil deposits. The exploitation of such oils is associated with various physical and chemical processes depending mainly on chemical conversion of resins and asphaltenes. However, resins and asphaltene destruction generally results in reducing oil viscosity and increasing its mobility through the porous medium of the reservoir rock. The correlation between the reactions occurring within the reservoir and mineral composition and properties of the reservoir rock is noteworthy because of the influence generated from the latter factors on the process mechanisms. Moreover, some rock components may catalyze the process of asphaltenes and resins destruction. For this reason, many studies have been performed on the impact of different catalysts and reagents on intensifying resins and asphaltenes destruction and have shown an increase in the content of light saturated and aromatic hydrocarbons in oil composition. In addition, the study of the effect of plate salts and pH on the conversion of asphaltenes and the functioning of catalysts embedded in the formation still needs further improvement.

Technology, University of Turin,
Via P. Giuria 9, 10125 Turin, Italy

Message from the Editor-in-Chief

You are invited to contribute either a research article or a comprehensive review for consideration and publication in *Processes* (ISSN 2227-9717). *Processes* is published in open access format – research articles, reviews, and other content are released on the internet immediately after acceptance. The scientific community and the general public have unlimited, free access to the content. As an open access journal, *Processes* is supported by the authors and their institutes through the payment of article processing charges (APCs) for accepted papers. We would be pleased to welcome you as one of our authors.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), Ei Compendex, Inspec, AGRIS, and other databases.

Journal Rank: JCR - Q2 (*Engineering, Chemical*) / CiteScore - Q2 (*Chemical Engineering (miscellaneous)*)
