Message from the Guest Editor

Dear Colleagues,

Due to the problems caused by climate change and especially the increase in the population, which leads to an accelerated consumption of raw materials and the generation of waste products, it is increasingly necessary to focus on the recycling of materials and to incorporate them back into the value chain to give them a new use and to avoid the consumption of new raw materials.

The construction sector is a pioneer and has been recycling and reusing materials from its own industry but also from other industries for decades. This Special Issue takes a look at recycling and reusing materials to promote and contribute to tackling pollution and climate change.
