Perceiving and predicting the complex 3D structure of the dynamic world requires a combination of sophisticated geometric modeling, efficient learning abilities, as well as having the right 3D sensors and imaging devices. Today's research in robotics, computer vision, 3D sensing, and machine learning offers a plethora of fast algorithms, accurate 3D sensing capabilities, as well as powerful deep neural networks, which leverage the statistical properties of the moving 3D world. This Special Issue aims to bring together state-of-the-art research in all these directions for 3D learning, modeling, and prediction to establish a strong common foundation and create bridges towards next-generation models and methods.
