### Message from the Guest Editors

Sustainable Smart Cities and Artificial Intelligence offer an intensive evaluation of how sustainable Smart City establishments are made at different scales through automated means of thinking, for instance, geospatial information, data examination, data portrayal, clever related things, and quick natural frameworks handiness. Progress in electronic thinking brings us closer to making a consistently reproducible model of human-made and trademark structures, from urban regions and transportation establishments to utility frameworks. This continuous living model empowers us to manage and improve these working structures, making them dynamically observant. Smart Cities and Artificial Intelligence provide a multidisciplinary procedure, using speculative and applied pieces of information, for the evaluation of Smart City applications.
