Message from the Collection Editors

There have been significant improvements in the short-term survival following solid organ transplantation due to advances in immunosuppression and transplant techniques. However, long-term graft survival has lagged relatively behind and has now become one of the main problems in solid organ transplantation.

In this Topical Collection, we are making a call to action to stimulate researchers and clinicians to submit their invaluable studies of solid organ transplantation, including issues related to donors, allograft, and patient survival following transplantation that will provide additional knowledge and skills in the field of transplantation research, ultimately to improve outcomes after solid organ transplantation. Original investigations, review articles, as well as short communications are especially welcome.
