Message from the Guest Editors

Dear Colleagues,

A primary function of stormwater treatment systems is to sequester pollutants of concern to both public and ecosystem health, and restore more natural hydrology to urban catchments. Research has highlighted the importance of biological processes for irreversible removal of many pollutants, such as uptake by plants and transformations made by microbes, and contributions to stormwater volume reductions. However, more work is required to move beyond our current “black box” understanding of these processes, especially considering the critical importance of plants and microbes in treatment systems and our lack of knowledge as to how they competitively or complementarily interact. This Special Issue will be dedicated to addressing and understanding the role played by plants, microorganisms and their interactions in stormwater treatment systems.

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), Ei Compendex, GEOBASE, GeoRef, PubAg, AGRIS, CAPlus / SciFinder, Inspec, and other databases.

Journal Rank: JCR - Q2 (*Water Resources*) / CiteScore - Q1 (Water Science and Technology)
